7kyu Testing 1-2-3

Your team is writing a fancy new text editor and you've been tasked with implementing the line numbering.

Write a function which takes a list of strings and returns each line prepended by the correct number.

ARRAYS FUNDAMENTALS

7kyu Testing 1-2-3

☆ 754 🏆 258 🔄 93% of 6,265 📊 31,689 of 88,482 👤 acr ⚠️ 2 Issues Reported

Instructions Output

Time: 383ms Passed: 104 Failed: 0

Test Results:

Fixed Tests

Should handle empty arrays

Should handle ["a","b","c"] as ["1: a", "2: b", "3: c"]

Should handle all empty lines

Should handle some empty lines

Solution

```
1 def number(lines):
2     matn = []
3     for i, col in enumerate(lines):
4         matn.append(f"{i+1}: {col}")
5     return matn
6
```

Impressive! You may take your time to refactor/comment your solution. Submit when ready.

8kyu The Wide-Mouthed frog!

☆ 199 🏆 73 🔄 90% of 3,999 📊 16,207 of 43,364 👤 nbeck ⚠️ 2 Issues Reported

Instructions Output

The wide-mouth frog is particularly interested in the eating habits of other creatures.

He just can't stop asking the creatures he encounters what they like to eat. But, then he meets the alligator who just LOVES to eat wide-mouthed frogs!

When he meets the alligator, it then makes a tiny mouth.

Your goal in this kata is to create complete the `mouth_size` method this method takes one argument `animal` which corresponds to the animal encountered by the frog. If this one is an `alligator` (case-insensitive) return `small` otherwise return `wide`.

Solution

```
1 def mouth_size(animal):
2     return "small" if animal.lower() == "alligator" else "wide"
```

Correctamundo! You may take your time to refactor/comment your solution. Submit when ready.

Sample Tests

```
1 import codewars_test as test
2 from solution import mouth_size
```

8kyu A wolf in sheep's clothing

☆ 573 🏆 170 🔄 91% of 3,775 📊 13,468 of 39,444 👤 jkempster34

Instructions Output

If the wolf is the closest animal to you, return "Pls go away and stop eating my sheep". Otherwise, return "Oi! Sheep number N! You are about to be eaten by a wolf!" where N is the sheep's position in the queue.

Note: there will always be exactly one wolf in the array.

Examples

Input: ["sheep", "sheep", "sheep", "wolf", "sheep"]
Output: "Oi! Sheep number 1! You are about to be eaten by a wolf!"

Input: ["sheep", "sheep", "wolf"]
Output: "Pls go away and stop eating my sheep"

Solution

```
1 def warn_the_sheep(queue):
2     if queue[-1] == "wolf":
3         return "Pls go away and stop eating my sheep"
4
5     wolf_index = queue.index("wolf")
6     sheep_number = len(queue) - wolf_index - 1
7
8     return f"Oi! Sheep number {sheep_number}! You are about to be eaten by a wolf!"
```

Great! You may take your time to refactor/comment your solution. Submit when ready.

Sample Tests

```
1 import codewars_test as test
2 from solution import warn_the_sheep
3
```
